

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently Amended) A photoelectric converting device comprising:
a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, said PCC being selectively operable, irrespective of the amount of the light, in either one of (1) a first mode in which said PCC generates the analog electric signal in such a way that intensity thereof is logarithmically proportional to the amount of the light and (2) a second mode in which said PCC generates the analog electric signal in such a way that intensity thereof is linearly proportional to the amount of the light, the PCC comprising:
a photoelectric conversion element having a direct-current voltage applied to a first electrode thereof; and
a first transistor capable of logarithmic conversions and having a first electrode, a second electrode, and a control electrode, the first electrode of the transistor being connected to a second electrode of the photoelectric conversion element;
wherein switching between the first and second modes is achieved by varying a potential at the second electrode of the first transistor.
2. (Withdrawn) A photoelectric converting device as claimed in claim 1, further comprising:
a capacitor connected to said PCC so as to be charged by the analog electric signal outputted from said PCC.
3. (Withdrawn) A photoelectric converting device as claimed in claim 2, further comprising:
a reset circuit, connected to said capacitor, for resetting said capacitor.

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

4. (Currently Amended) A photoelectric converting device as claimed in claim 3, wherein said reset circuit comprises a second transistor having a first electrode, a second electrode, and a control electrode, said first electrode of said second transistor being connected to said capacitor, wherein said capacitor is reset when an electric signal is applied to said control electrode of said second transistor so as to make a path between said first and second electrodes of said second transistor conduct.

5. (Original) A photoelectric converting device as claimed in claim 1, further comprising:

an amplifying circuit, connected to said PCC, for amplifying the analog electric signal outputted from said PCC.

6. (Withdrawn) A photoelectric converting device as claimed in claim 5, further comprising:

a capacitor provided between said PCC and said amplifying circuit so as to be charged by the analog electric signal outputted from said PCC, wherein said amplifying circuit amplifies the analog electric signal by which said capacitor is charged.

7. (Withdrawn) A photoelectric converting device as claimed in claim 6, further comprising:

a reset circuit, connected to said capacitor, for resetting said capacitor.

8. (Original) A photoelectric converting device as claimed in claim 5, wherein no capacitor is provided between said PCC and said amplifying circuit.

9. (Currently Amended) A photoelectric converting device as claimed in claim 1,

wherein said PCC comprises:

~~a photoelectric conversion element that receives at a first electrode thereof a direct current voltage;~~

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

~~a first transistor having a first electrode, a second electrode, and a control electrode, the first and control electrodes of said first transistor being connected to [[a]] the second electrode of said photoelectric conversion element so as to receive an output current from said photoelectric conversion element,~~

and said PCC further comprises:

a second transistor having a first electrode, a second electrode, and a control electrode, said second transistor receiving at the first electrode thereof a direct-current voltage, the control electrode of said second transistor being connected to the control electrode of said first transistor, and said second transistor outputting at the second electrode thereof the analog electric signal,

wherein, by varying a potential difference between the first and second electrodes of said first transistor, how said PCC operates is switched between said first and second modes.

10. (Withdrawn) A photoelectric converting device as claimed in claim 9, further comprising:

a reset circuit for initializing said PCC after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line.

11. (Withdrawn) A photoelectric converting device as claimed in claim 9, wherein said PCC has a third transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said third transistor being connected to the control electrode of said first and second transistors, the second electrode of said third transistor being connected to a direct-current voltage,

wherein, after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line, said PCC is reset by varying a voltage level applied to the control electrode of said third transistor so as to make said third transistor conduct so that said first and second transistors discharge electric charge accumulated therein.

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

12. (Currently Amended) A photoelectric converting device as claimed in claim 1, wherein ~~said PCC comprises: a photoelectric conversion element that receives at a first electrode thereof a direct current voltage; a first transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said first transistor being connected to a second electrode of said photoelectric conversion element so as to receive~~ receives an output current from said photoelectric conversion element, and the second and control electrodes of said first transistor ~~being~~ are connected together, and the PCC further comprises:

a second transistor having a first electrode, a second electrode, and a control electrode, said second transistor receiving at the first electrode thereof a direct-current voltage, the control electrode of said second transistor being connected to the first electrode of said first transistor, said second transistor outputting at the second electrode thereof the analog electric signal,

wherein, by varying a potential difference between the first and second electrodes of said first transistor, how said PCC operates is switched between said first and second modes.

13. (Withdrawn) A photoelectric converting device as claimed in claim 12, further comprising:

a reset circuit for initializing said PCC after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line.

14. (Withdrawn) A photoelectric converting device as claimed in claim 12, wherein said PCC has a third transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said third transistor being connected to the control electrode of said second transistor, the second electrode of said third transistor being connected to a direct-current voltage,

wherein, after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line, said PCC is reset by varying a voltage level applied

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

to the control electrode of said third transistor so as to make said third transistor conduct so that said first and second transistors discharge electric charge accumulated therein.

15. (Currently Amended) A photoelectric converting device ~~as claimed in claim 1 comprising:~~

a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, said PCC being selectively operable, irrespective of the amount of the light, in either one of (1) a first mode in which said PCC generates the analog electric signal in such a way that intensity thereof is logarithmically proportional to the amount of the light and (2) a second mode in which said PCC generates the analog electric signal in such a way that intensity thereof is linearly proportional to the amount of the light, wherein said PCC comprises:

a photoelectric conversion element that receives at a second electrode thereof a direct-current voltage;

a first transistor having a first electrode, a second electrode, and a control electrode, the second electrode of said first transistor being connected to a first electrode of said photoelectric conversion element, and

a second transistor having a first electrode, a second electrode, and a control electrode, said second transistor receiving at the first electrode thereof a direct-current voltage, the control electrode of said second transistor being connected to the second electrode of said first transistor, said second transistor outputting at the second electrode thereof the analog electric signal,

wherein, by varying a voltage fed to the control electrode of said first transistor, how said PCC operates is switched between said first and second modes.

16. (Withdrawn) A photoelectric converting device as claimed in claim 15, wherein said PCC has a third transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said third transistor being connected to the second electrode of said first transistor, the second electrode of said third transistor being connected to the first electrode of said photoelectric conversion element, said third

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

transistor thus being connected in series with said first transistor and said photoelectric conversion element,

wherein, while said PCC is operating in said first mode, said third transistor is kept in a conducting state during a shooting operation and is kept in a non-conducting state during an operation for detecting variations in sensitivity of individual pixels, and

wherein, while said PCC is operating in said second mode, said third transistor is kept in an conducting state all the time.

17. (Currently Amended) A photoelectric converting device comprising:

a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, said PCC being selectively operable, based on a signal inputted to said photoelectric converting device, in either one of (1) a first mode in which said PCC generates the analog electric signal in such a way that intensity thereof is logarithmically proportional to the amount of the light and (2) a second mode in which said PCC generates the analog electric signal in such a way that intensity thereof is linearly proportional to the amount of the light,

wherein the photoelectric conversion circuit comprises:

a photoelectric conversion element having a direct-current voltage applied to a first electrode thereof; and

a transistor capable of logarithmic conversions and having a first electrode, a second electrode, and a control electrode, the first electrode of the transistor being connected to a second electrode of the photoelectric conversion element,

wherein switching between the first and second modes is achieved by varying a potential at the second electrode of the transistor.

18. (Withdrawn) A photoelectric converting device as claimed in claim 17, further comprising:

a capacitor connected to said PCC so as to be charged by the analog electric signal outputted from said PCC.

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

19. (Withdrawn) A photoelectric converting device as claimed in claim 18, further comprising:

a reset circuit, connected to said capacitor, for resetting said capacitor.

20. (Withdrawn) A photoelectric converting device as claimed in claim 19, wherein said reset circuit comprises a transistor having a first electrode, a second electrode, and a control electrode, said first electrode being connected to said capacitor, wherein said capacitor is reset when an electric signal is applied to said control electrode so as to make a path between said first and second electrodes conduct.

21. (Original) A photoelectric converting device as claimed in claim 17, further comprising:

an amplifying circuit, connected to said PCC, for amplifying the analog electric signal outputted from said PCC.

22. (Withdrawn) A photoelectric converting device as claimed in claim 21, further comprising:

a capacitor provided between said PCC and said amplifying circuit so as to be charged by the analog electric signal outputted from said PCC, wherein said amplifying circuit amplifies the analog electric signal by which said capacitor is charged.

23. (Withdrawn) A photoelectric converting device as claimed in claim 22, further comprising:

a reset circuit, connected to said capacitor, for resetting said capacitor.

24. (Original) A photoelectric converting device as claimed in claim 21, wherein no capacitor is provided between said PCC and said amplifying circuit.

25. (Withdrawn) A photoelectric converting device as claimed in claim 17, wherein said PCC comprises:

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage;

a first transistor having a first electrode, a second electrode, and a control electrode, the first and control electrodes of said first transistor being connected to a second electrode of said photoelectric conversion element so as to receive an output current from said photoelectric conversion element, and

a second transistor having a first electrode, a second electrode, and a control electrode, said second transistor receiving at the first electrode thereof a direct-current voltage, the control electrode of said second transistor being connected to the control electrode of said first transistor, said second transistor outputting at the second electrode thereof the analog electric signal,

wherein, by varying a potential difference between the first and second electrodes of said first transistor, how said PCC operates is switched between said first and second modes.

26. (Withdrawn) A photoelectric converting device as claimed in claim 25, further comprising:

a reset circuit for initializing said PCC after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line.

27. (Withdrawn) A photoelectric converting device as claimed in claim 25, wherein said PCC has a third transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said third transistor being connected to the control electrode of said first and second transistors, the second electrode of said third transistor being connected to a direct-current voltage,

wherein, after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line, said PCC is reset by varying a voltage level applied to the control electrode of said third transistor so as to make said third transistor conduct so that said first and second transistors discharge electric charge accumulated therein.

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

28. (Withdrawn) A photoelectric converting device as claimed in claim 17, wherein said PCC comprises:
- a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage;
- a first transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said first transistor being connected to a second electrode of said photoelectric conversion element so as to receive an output current from said photoelectric conversion element, the second and control electrodes of said first transistor being connected together, and
- a second transistor having a first electrode, a second electrode, and a control electrode, said second transistor receiving at the first electrode thereof a direct-current voltage, the control electrode of said second transistor being connected to the first electrode of said first transistor, said second transistor outputting at the second electrode thereof the analog electric signal,
- wherein, by varying a potential difference between the first and second electrodes of said first transistor, how said PCC operates is switched between said first and second modes.
29. (Withdrawn) A photoelectric converting device as claimed in claim 28, further comprising:
- a reset circuit for initializing said PCC after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line.
30. (Withdrawn) A photoelectric converting device as claimed in claim 28, wherein said PCC has a third transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said third transistor being connected to the control electrode of said second transistor, the second electrode of said third transistor being connected to a direct-current voltage,
- wherein, after said PCC has operated in said second mode and outputted the analog electric signal to an output signal line, said PCC is reset by varying a voltage level applied

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

to the control electrode of said third transistor so as to make said third transistor conduct so that said first and second transistors discharge electric charge accumulated therein.

31. (Currently Amended) A photoelectric converting device ~~as claimed in claim 17 comprising:~~

a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, said PCC being selectively operable, based on a signal inputted to said photoelectric converting device, in either one of (1) a first mode in which said PCC generates the analog electric signal in such a way that intensity thereof is logarithmically proportional to the amount of the light and (2) a second mode in which said PCC generates the analog electric signal in such a way that intensity thereof is linearly proportional to the amount of the light, wherein said PCC comprises:

a photoelectric conversion element that receives at a second electrode thereof a direct-current voltage;

a first transistor having a first electrode, a second electrode, and a control electrode, the second electrode of said first transistor being connected to a first electrode of said photoelectric conversion element, and

a second transistor having a first electrode, a second electrode, and a control electrode, said second transistor receiving at the first electrode thereof a direct-current voltage, the control electrode of said second transistor being connected to the second electrode of said first transistor, said second transistor outputting at the second electrode thereof the analog electric signal,

wherein, by varying a voltage fed to the control electrode of said first transistor, how said PCC operates is switched between said first and second modes.

32. (Withdrawn) A photoelectric converting device as claimed in claim 31, wherein said PCC has a third transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said third transistor being connected to the second electrode of said first transistor, the second electrode of said third transistor being connected to the first electrode of said photoelectric conversion element, said third

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

transistor thus being connected in series with said first transistor and said photoelectric conversion element,

wherein, while said PCC is operating in said first mode, said third transistor is kept in a conducting state during a shooting operation and is kept in a non-conducting state during an operation for detecting variations in sensitivity of individual pixels, and

wherein, while said PCC is operating in said second mode, said third transistor is kept in an conducting state all the time.

33. (Currently Amended) A photoelectric converting device comprising:

a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, wherein intensity of the analog electric signal is logarithmically proportional to the amount of the light; and

an amplifying circuit, connected to said PCC, for amplifying the analog electric signal outputted from said PCC, wherein no capacitor is provided between said PCC and said amplifying circuit; and

a load resistor or constant-current source that is connected to the output signal line to which the amplifying transistor outputs a signal;

wherein said amplifying circuit is an amplifying transistor that amplifies the analog electric signal outputted from said PCC and fed to the control electrode without being integrated,

wherein the analog electric signal outputted from said PCC is a voltage signal, and

wherein said amplifying transistor is a MOS transistor that receives at a gate electrode thereof the voltage signal outputted from said PCC, that receives at a first electrode thereof a direct-current voltage, and that has a second electrode thereof connected to an output signal line.

34-36 (Cancelled)

37. (Currently Amended) A photoelectric converting device as claimed in claim 33 [[36]],

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

wherein said load resistor or constant-current source is a resistive transistor having a first electrode thereof connected to the output signal line, having a second electrode thereof connected to a direct-current voltage, and having a control electrode thereof connected to a direct-current voltage.

38. (Original) A photoelectric converting device as claimed in claim 37 wherein said amplifying transistor is an N-channel MOS transistor, and the direct-current voltage applied to the first electrode of said amplifying transistor is higher than the direct-current voltage connected to the second electrode of said resistive transistor.

39. (Withdrawn) A photoelectric converting device as claimed in claim 37 wherein said amplifying transistor is a P-channel MOS transistor, and the direct-current voltage applied to the first electrode of said amplifying transistor is lower than the direct-current voltage connected to the second electrode of said resistive transistor.

40. (Withdrawn) A photoelectric converting device as claimed in claim 33, wherein said PCC comprises:
a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage; and
a transistor having a first electrode, a second electrode, and a control electrode, the first and control electrodes of said transistor being connected to a second electrode of the photoelectric conversion element so as to receive an output current from the photoelectric conversion element,

wherein a voltage signal appearing at the control electrode of said transistor is used as an output signal.

41. (Withdrawn) A photoelectric converting device as claimed in claim 33, wherein said PCC comprises:
a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage; and

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

a transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said transistor being connected to a second electrode of the photoelectric conversion element so as to receive an output current from the photoelectric conversion element, the second and control electrodes of said transistor being connected together,

wherein a voltage signal appearing at the first electrode of said transistor is used as an output signal.

42. (Currently Amended) A photoelectric converting device ~~as claimed in claim 33 comprising:~~

a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, wherein intensity of the analog electric signal is logarithmically proportional to the amount of the light, wherein said PCC comprises:

a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage; and

a transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said transistor being connected to a second electrode of the photoelectric conversion element so as to receive an output current from the photoelectric conversion element, said transistor receiving at the control electrode thereof a direct-current voltage,

wherein a voltage signal appearing at the first electrode of said transistor is used as an output signal; and

an amplifying circuit, connected to said PCC, for amplifying the analog electric signal outputted from said PCC, wherein no capacitor is provided between said PCC and said amplifying circuit.

43. (Withdrawn) A photoelectric converting device as claimed in claim 33, wherein said PCC comprises:

a photodiode that receives at a first electrode thereof a direct-current voltage; and

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

a MOS transistor having a first electrode, a second electrode, and a gate electrode, the first and gate electrodes of said MOS transistor being connected to a second electrode of the photodiode so as to receive an output current from the photodiode,

wherein a voltage signal appearing at the gate electrode of said MOS transistor when said MOS transistor is made to operate in a subthreshold region below a threshold level thereof is used as an output signal.

44. (Withdrawn) A photoelectric converting device as claimed in claim 33, wherein said PCC comprises:

a photodiode that receives at a first electrode thereof a direct-current voltage; and a MOS transistor having a first electrode, a second electrode, and a gate electrode, the first electrode of said MOS transistor being connected to a second electrode of the photodiode so as to receive an output current from the photodiode, the second and gate electrodes of said MOS transistor being connected together,

wherein a voltage signal appearing at the first electrode of said MOS transistor when said MOS transistor is made to operate in a subthreshold region below a threshold level thereof is used as an output signal.

45. (Currently Amended) A photoelectric converting device as claimed in claim 42 [[33]],

wherein said PCC comprises:

a photodiode that receives at a first electrode thereof a direct-current voltage; and a MOS transistor having a first electrode, a second electrode, and a gate electrode, the first electrode of said MOS transistor being connected to a second electrode of the photodiode so as to receive an output current from the photodiode, said MOS transistor receiving at the gate electrode thereof a direct-current voltage,

wherein a voltage signal appearing at the first electrode of said MOS transistor when said MOS transistor is made to operate in a subthreshold region below a threshold level thereof is used as an output signal.

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

46. (Currently Amended) A photoelectric converting device comprising:
a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, wherein intensity of the analog electric signal is logarithmically proportional to the amount of the light; [[and]]
an amplifying circuit, connected to said PCC, for amplifying the analog electric signal outputted from said PCC, wherein no integrator circuit is provided between said PCC and said amplifying circuit; and
a load resistor or constant-current source that is connected to the output signal line to which the amplifying transistor outputs a signal,
wherein said amplifying circuit is an amplifying transistor that amplifies the analog electric signal outputted from said PCC and fed to the control electrode without being integrated
wherein the analog electric signal outputted from said PCC is a voltage signal, and
wherein said amplifying transistor is a MOS transistor that receives at a gate electrode thereof the voltage signal outputted from said PCC, that receives at a first electrode thereof a direct-current voltage, and that has a second electrode thereof connected to an output signal line.

47-49 (Cancelled)

50. (Currently Amended) A photoelectric converting device as claimed in claim 46 [[49]],

wherein said load resistor or constant-current source is a resistive transistor having a first electrode thereof connected to the output signal line, having a second electrode thereof connected to a direct-current voltage, and having a control electrode thereof connected to a direct-current voltage.

51. (Currently Amended) A photoelectric converting device as claimed in claim 50,

wherein said amplifying transistor is an N-channel MOS transistor, and the direct-current voltage applied applied to the first electrode of said amplifying transistor is higher

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

than the direct-current voltage connected to the second electrode of said resistive transistor.

52. (Withdrawn) A photoelectric converting device as claimed in claim 50, wherein said amplifying transistor is a P-channel MOS transistor, and the direct-current voltage applied to the first electrode of said amplifying transistor is lower than the direct-current voltage connected to the second electrode of said resistive transistor.

53. (Withdrawn) A photoelectric converting device as claimed in claim 46, wherein said PCC comprises:
a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage; and
a transistor having a first electrode, a second electrode, and a control electrode, the first and control electrodes of said transistor being connected to a second electrode of the photoelectric conversion element so as to receive an output current from the photoelectric conversion element,
wherein a voltage signal appearing at the control electrode of said transistor is used as an output signal.

54. (Withdrawn) A photoelectric converting device as claimed in claim 46, wherein said PCC comprises:
a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage; and
a transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said transistor being connected to a second electrode of the photoelectric conversion element so as to receive an output current from the photoelectric conversion element, the second and control electrodes of said transistor being connected together,
wherein a voltage signal appearing at the first electrode of said transistor is used as an output signal.

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

55. (Currently Amended) A photoelectric converting device ~~as claimed in claim 46, comprising:~~

a photoelectric conversion circuit (PCC) for generating an analog electric signal in accordance with an amount of incident light, wherein intensity of the analog electric signal is logarithmically proportional to the amount of the light, wherein said PCC comprises:

a photoelectric conversion element that receives at a first electrode thereof a direct-current voltage; and

a transistor having a first electrode, a second electrode, and a control electrode, the first electrode of said transistor being connected to a second electrode of the photoelectric conversion element so as to receive an output current from the photoelectric conversion element, said transistor receiving at the control electrode thereof a direct-current voltage,

wherein a voltage signal appearing at the first electrode of said transistor is used as an output signal; and

an amplifying circuit, connected to said PCC, for amplifying the analog electric signal outputted from said PCC, wherein no integrator circuit is provided between said PCC and said amplifying circuit.

56. (Withdrawn) A photoelectric converting device as claimed in claim 46, wherein said PCC comprises:

a photodiode that receives at a first electrode thereof a direct-current voltage; and

a MOS transistor having a first electrode, a second electrode, and a gate electrode, the first and gate electrodes of said MOS transistor being connected to a second electrode of the photodiode so as to receive an output current from the photodiode,

wherein a voltage signal appearing at the gate electrode of said MOS transistor when said MOS transistor is made to operate in a subthreshold region below a threshold level thereof is used as an output signal.

57. (Withdrawn) A photoelectric converting device as claimed in claim 46, wherein said PCC comprises:

Application No. 09/537,425
Amendment dated April 13, 2005
Reply to Office Action of January 13, 2005

a photodiode that receives at a first electrode thereof a direct-current voltage; and
a MOS transistor having a first electrode, a second electrode, and a gate electrode,
the first electrode of said MOS transistor being connected to a second electrode of the
photodiode so as to receive an output current from the photodiode, the second and gate
electrodes of said MOS transistor being connected together,

wherein a voltage signal appearing at the first electrode of said MOS transistor
when said MOS transistor is made to operate in a subthreshold region below a threshold
level thereof is used as an output signal.

58. (Currently Amended) A photoelectric converting device as claimed in
claim 55 [[46]], wherein ~~said PCC comprises:~~ said photoelectric conversion element is a
~~photodiode that receives at a first electrode thereof a direct current voltage; and;~~ said
transistor is a MOS transistor ~~having a first electrode, a second electrode, and a gate~~
~~electrode, the first electrode of said MOS transistor being connected to a second electrode~~
~~of the photodiode so as to receive an output current from the photodiode, said MOS~~
~~transistor receiving at , the control electrode being the gate electrode thereof a direct-~~
~~current voltage,; and~~

wherein a voltage signal appearing at [[the]] a first electrode of said MOS
transistor when said MOS transistor is made to operate in a subthreshold region below a
threshold level thereof is used as [[an]] the output signal.
